

Andel FloodWall

For effective flood defence

An innovative, modular, low-cost alternative
for effective perimeter flood defence

Protecting your assets. Protecting the environment.

Andel FloodWall for effective flood defence

Andel FloodWall is an innovative, modular, cost-effective perimeter flood defence system designed to prevent damage to your assets from floodwater.

Easy assembly

Andel FloodWall is designed for easy transportation and can be quickly assembled on site in a similar way to conventional perimeter fencing – with special steel-reinforced sections and upright posts that are concreted deep into the ground.

Environmentally friendly construction

Above ground level, the sections and posts are moulded from non-porous, 100% post-industrial, recycled plastic waste with an aesthetically sympathetic wood-grain textured finish.

Robust and watertight

All the units are sealed and watertight and at ground level, Andel FloodWall fits into a substantial concrete board that runs below ground, out of

sight, for the full length of the floodwall – providing a robust and effective watertight and weight-bearing defence against floodwater.

- Cost-effective compared to traditional flood defence systems
- Modular system for easy transportation and speedy on-site assembly
- Suitable for both new build and retrofit installations
- Reduces carbon footprint compared to all-concrete construction
- Sections and posts constructed from non-porous, durable, 100% post-industrial recycled plastic waste
- Aesthetically sympathetic wood grain textured finish
- Steel reinforced sections and posts for added strength

Designed and tested to meet PAS 1188-2:2014
